PROFESSIONAL SUMMARY

Result-oriented Android Developer with 3+ years of dedicated experience building robust, scalable, and user-friendly mobile applications using Kotlin, Jetpack Compose, and MVVM architecture. Strong foundation in UI/UX design, system-level media playback, and developing offline-first apps with Media3 integration and background task optimization using WorkManager. Proficient in RealmDB, Room, and Firebase for real-time, crash-resilient app development. Passionate about clean architecture, modular design, and delivering seamless, high-quality user experiences from code to Play Store publication.

TECHNICAL SKILLS

- **Languages & UI Frameworks:** Kotlin (Primary), Jetpack Compose, XML Layouts, Kotlin DSL, Java (Basic)
 - **Architecture & Patterns:** MVVM, Repository Pattern
 - **Concurrency & State Management:** Kotlin Coroutines, StateFlow, LiveData, WorkManager, DownloadManager
 - **Dependency Injection:** Hilt (ViewModel & Repository injection)
 - **Networking & Cloud:** Retrofit (with Coroutines & sealed result handling), AWS, Google Drive API / Cloud Storage Integration
 - **Databases & Storage:** Room DB, Realm DB, MongoDB Atlas, Firebase (Auth, Crashlytics, Analytics)
 - **Media & Playback:** Media3 (ExoPlayer, MediaSessionService), Audio Queue Management, Equalizer UI implementations
 - **Build & Version Control:** Gradle (Kotlin DSL), Git, GitHub, GitHub Actions, Version Catalogs (`libs.versions.toml`)
 - **App Distribution & ASO:** Google Play Console, Internal/Closed Track Testing, Store Listing Optimization
 - **Debugging & Testing:** Espresso (Automated UI Testing with reusable components), Firebase Crashlytics, Logcat

PROFESSIONAL EXPERIENCE

Independent Android Developer

March 2025 – Present

Project: [Iplay Music Player](#) (Available in Google Play Store)

Tech Stack: Kotlin, Jetpack Compose, MVVM, Media3, Realm DB, Hilt

- Architected and developed a comprehensive offline music player from scratch, utilizing **Clean Architecture principles and Hilt for dependency injection** to ensure a scalable, decoupled codebase from initial UI/UX design to Play Store deployment.
- Engineered complex media architecture using **Media3's MediaSessionService combined with Foreground Services and Audio Focus handling**, guaranteeing seamless background playback and system-level media notifications without system-induced interruptions.
- Implemented a reactive database pipeline using **Realm DB alongside Kotlin Flow and Coroutines**, asynchronously querying the Android **MediaStore API** to parse and load large local media libraries without blocking the UI thread.
- Developed a custom Equalizer UI with Jetpack. Compose sliders and preset selections, optimizing UI rendering performance by **leveraging state hoisting and remember blocks** to prevent unnecessary recompositions during fluid animations.
- Managed end-to-end release via the Google Play Console, successfully navigating modern Android API requirements, including **Scoped Storage APIs and Android 14+ Foreground Service (Media Playback) permissions**, to secure production approval.

Survey Heart – Android, iOS & Web

Junior Android Developer | Sept 2022 – Nov 2024 (2.4 years)

Tech Stack: Kotlin, Coroutines, XML, MVVM, Room DB, Realm DB, Retrofit, WorkManager, Firebase Crashlytics, Espresso

- Designed an interactive 'Spotlight' onboarding feature to highlight new application capabilities, Integrating targeted YouTube video redirects to improve feature discovery and user adoption.
- Developed a comprehensive cloud storage management system integrating a custom backend API and MongoDB, enabling users to seamlessly view and delete their uploaded image files hosted on AWS.
- Contributed to a major architectural shift by assisting in the database migration from Room to Realm DB, improving cross-platform data handling and query performance.
- Engineered with a resilient background download pipeline using DownloadManager, WorkManager, and Coroutines, ensuring the seamless and uninterrupted retrieval of large files without blocking the main thread.
- Accelerated bug resolution by integrating Firebase Crashlytics with a custom post-crash feedback system, allowing users to attach screen recordings and comments upon relaunch.

- Scaled the core survey engine by developing dynamic, reusable UI components to quickly support and render complex new inputs, including signature, ranking, and slider question types.
- Reduced data synchronization failures on unstable networks by implementing WorkManager for reliable, deferred background syncing of user responses.
- Bolstered application reliability by authoring automated UI tests using Espresso and building reusable test components to streamline the QA workflow.

EDUCATION & CERTIFICATIONS

Bachelor of Commerce (Computers) | Kakatiya University, Khammam (2015)

Intermediate (Vocational) | Govt Junior College, Khammam (2011)

SSC | Zilla Parishad High School, Khammam (2009)

- Android Development with Kotlin – Udemy
- Advanced Android Development – Google Developers (Ongoing)
